Introduction

This document shows the bookmarks of a PDF: each heading has a bookmark before it, which puts it in the viewer's bookmark panel and gives links a place to jump to. The contents page lists them with their page numbers, which the engine works out after laying out the rest of the document.

Background

A bookmark draws nothing. It marks the element that follows it, so a heading pushed to the next page takes its bookmark along. See Methods for how the numbers are found, or go back to the contents.

Methods

The table of contents is laid out last. Its own length moves the pages after it, so it is laid out again with that length counted, until the length holds.

Data Collection

Entries below the first level are indented by toc-indent-step for each level.

Sampling

A third level nests under the second, in the outline and in the contents.

Results

Every entry in the contents is a link to its bookmark.
