Made with Lpdf

Code

Run `cargo test` before you push, and open the `README.md` in the repository for how to read what it prints.

A block

```
fn main() {
    let items = [3, 5, 8];
    let total: i32 = items.iter().sum();

    println!("total = {}", total);
}
```

Words in color

```
fn greeting(name: &str) -> String {
    let text = "hello, ".to_string() + name;
    return text;
}
```

Long lines wrap

```
// A comment that is longer than the box
wraps at a space, and the next line starts
at the left edge.
let url = "https://example.com/documents/20
26/10/25/a-very-long-address-with-no-space-
in-it-at-all/index.html";
```

Tabs

```
name    value
a   1
bcd 2
```

```
name    value
a       1
bcd     2
```

A look of its own

```
SELECT name, total
  FROM invoices
 WHERE total > 100
 ORDER BY total DESC;
```

In a sentence

A code-span stays inside its line, like `let x = 1;` here, and a line that is long enough wraps around it. One has colors of its own, `white on blue`, and the text goes on after it.
